

Code alpha

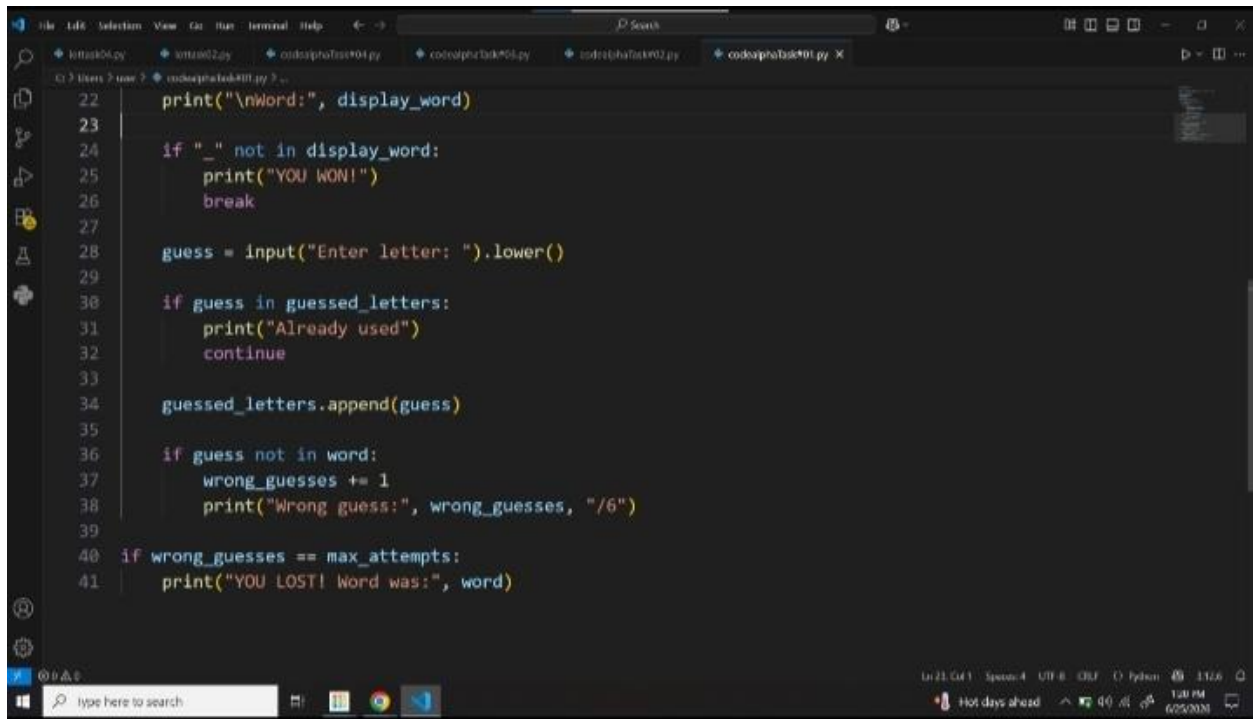

Task#01: Hangman Game

Code

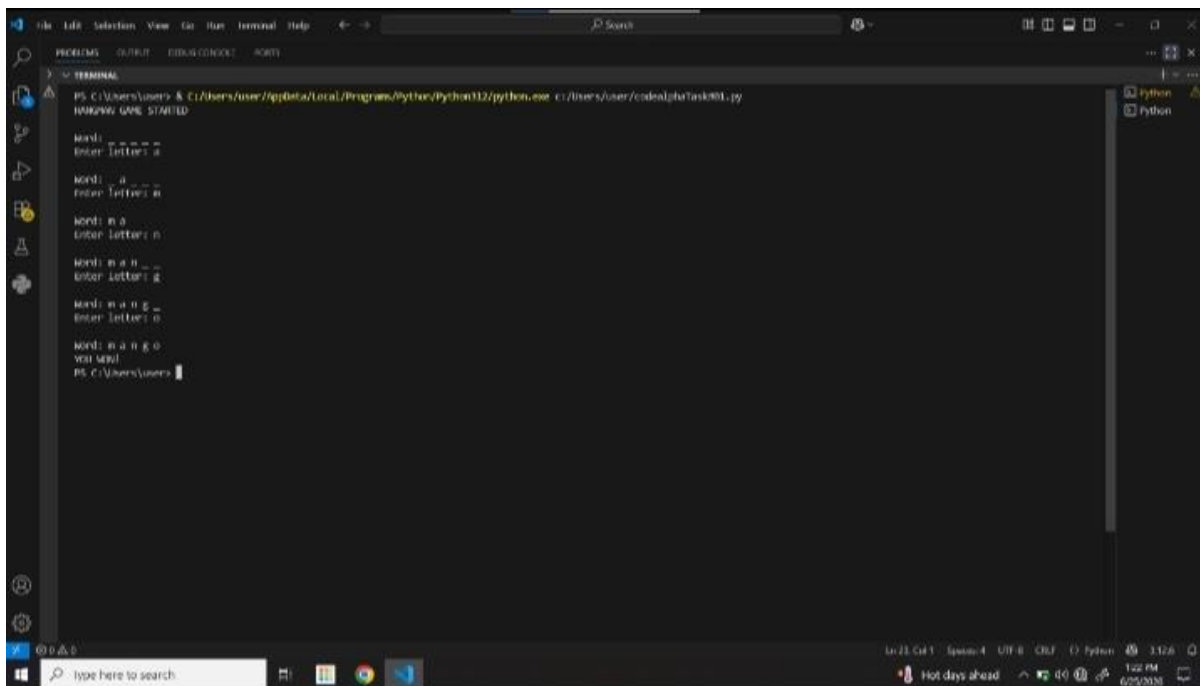

```
1 #Task#01:Hangman Game
2 import random
3
4 words = ["apple", "mango", "grape", "banana", "orange"]
5 word = random.choice(words)
6 (variable) guessed_letters: list
7 guessed_letters = []
8 wrong_guesses = 0
9 max_attempts = 6
10
11 print("HANGMAN GAME STARTED")
12
13 while wrong_guesses < max_attempts:
14     display_word = ""
15
16     for letter in word:
17         if letter in guessed_letters:
18             display_word += letter + " "
19         else:
20             display_word += "_ "
21
22     print("\nWord:", display_word)
23
```

The screenshot shows a code editor with a dark theme. The code is written in Python and implements a Hangman game. It starts by importing the random module and defining a list of words. A word is chosen randomly, and a list for guessed letters is initialized. The game loop continues until the number of wrong guesses reaches the maximum attempts. Inside the loop, the current word is displayed with underscores for unguessed letters. The status bar at the bottom indicates the file is 'codealphaTask#01.py', the editor is in 'Python' mode, and the system clock shows 1:38 PM on 05/05/2022.

```
22 print("\nWord:", display_word)
23
24 if "_" not in display_word:
25     print("YOU WON!")
26     break
27
28 guess = input("Enter letter: ").lower()
29
30 if guess in guessed_letters:
31     print("Already used")
32     continue
33
34 guessed_letters.append(guess)
35
36 if guess not in word:
37     wrong_guesses += 1
38     print("Wrong guess:", wrong_guesses, "/6")
39
40 if wrong_guesses == max_attempts:
41     print("YOU LOST! Word was:", word)
```

Output

```
PS C:\Users\user> C:\Users\user\AppData\Local\Programs\Python\Python32\python.exe c:/Users/user/codealgotask01.py
PYTHON GAME STARTED
Word: _ _ _ _ _
Enter letter: a
Word: a _ _ _ _
Enter letter: n
Word: n a _ _ _
Enter letter: g
Word: n a n _ _
Enter letter: o
Word: n a n g _
Enter letter: o
Word: n a n g o
YOU WON!
